Background Information Services Division (ISD) produces information in support of the objectives set out in the December 2015 “Strategic Framework for Action on Palliative and End of Life Care”\(^1\). One of its commitments is to “support improvements in the collection, analysis, interpretation and dissemination of data and evidence relating to needs, provision, activity, indicators and outcomes in respect of palliative and end of life care”.

Palliative care is an approach that improves the quality of life for patients and their families facing the problems associated with life-threatening illness. This is achieved through the prevention and relief of suffering by means of early identification, assessment and treatment of pain and other physical, psychosocial and spiritual problems.

**End of Life Care** is the part of palliative care for people who are nearing the end of their life, whether or not they are already in receipt of palliative care. This phase could vary between weeks, days or hours in the context of different disease trajectories. There can be uncertainty involved in identifying when someone might be expected to die – illness can be unpredictable, and changes can occur suddenly and unexpectedly.

**Annual Publication**

One of the ways ISD supports reporting on Palliative care is through its annual publication on the last 6 months of life spent at home or in the community setting. This uses hospital information and death records to report on the last 6 months of life.

### Key Statistics in 2017/18\(^2\)\(^3\)

- **56,736 deaths** in 2017/18
- **87.9%** at home/community
- **12.1%** in hospital
- Average of 22 days per person spent in the hospital

---

#### What do we know from Hospital, Hospice and Community data?

Authors - Aghimien Iyayi-Igbinovia, Principal Information Analyst
Andrew Mooney, Senior Information Analyst

- In 2017/18, **87.9%** of the last 6 months of life was spent at home or in a community setting, with the remaining **12.1%** spent in hospital.
- The chart below shows the time spent at home or in a community setting increased slightly from 85.3% in 2010/11 to 87.9% in 2017/18.

**Place of Death**

- In 2017/18, **47%** of deaths occurred in a hospital setting, **26%** at home, **20%** in a care home and **7%** in an inpatient hospice unit.
- The chart below shows trends in the place of death in Scotland over a 4 year period.
